

Gianfranco Gosdinski Lopez

Web Fundamentals Section 19

15/02/2023

## **Introduction and Objectives**

This website was created as a repository to showcase who I am and my work to potential employees. Its purpose is to explain in a simple way what data analysis is and how it can be used in all companies around the world. The audience for this website is a wide range of people who are business owners or have high-level positions in companies from different industries, especially those that are Start-Ups.

The idea is that they visit my website and have a way to contact me so that I can put my knowledge and skills to the benefit of their companies.

You can visit my website by clicking the link below:

## **Design Process**

I wanted my website to look simple and organized. I tried to give enough information so that people can contact me if they want to know more about me and data analysis. I designed the layout following the course requirements, but I tried to put some of myself into this project. My first idea was to create 3 pages, the first would be "The Home Page", the second and third would be "Benefits of Data Analysis" and the "About Me" page. But I changed this when I was in the process of designing the HTML for each page. The final version of the project also has 3 pages, which are: the home page, the about page, and the contact page. I think that in this order I have a better impact on my audience and they can better understand the purpose of the site.

## **Conclusion**

I've learned a lot about web development and found something new that I didn't know I love. I hope these new skills can help me find a job as a FrontEnd developer. I am motivated to continue studying JavaScript on my own to have the skills of a Full Stack Developer.
